EDUCATION

Lebanese International University
Bachelor of Science in Computer Science

Beirut, Lebanon
Oct 2022 – Jan 2026

SKILLS SUMMARY

- **Languages:** JavaScript, TypeScript, SQL, HTML5, CSS3
- **Frontend:** React, Vite, Tailwind CSS, Framer Motion, GSAP, Zustand, React Router, Radix UI
- **Backend:** Node.js, Express, REST APIs, Socket.io, BullMQ, JWT, OAuth (GitHub / Google), bcrypt, Zod, Joi
- **Databases:** MySQL, MongoDB, Redis, SQLite
- **Cloud & DevOps:** AWS (EC2, RDS, S3, IAM), Docker, Dockerode, Cloudflare (Workers, KV, DNS), nginx, Vercel, Git, GitHub Actions/Webhooks, systemd
- **AI Integration:** OpenAI API, agentic function-calling / tool-use, AI-assisted fraud review & insights

WORK EXPERIENCE

FULL-STACK DEVELOPER | Freelance (Self-employed)

Mar 2024 – Present

- Designed and developed full-stack SaaS and business applications using Node.js, React, and MySQL.
- Built secure REST APIs with JWT authentication, refresh-token rotation, and role-based access control.
- Deployed applications using Docker, AWS (EC2, RDS, S3), Vercel, Cloudflare, and cloud-hosted databases.
- Integrated AI-powered features using OpenAI APIs, from fraud-flag analysis to live-inventory assistants.
- Managed projects end to end — from database schema design through production deployment and monitoring.

PHARMACY MANAGER | Pharmacy Alexandre · Lebanon

Sep 2024 – Present

- Manage a high-volume community pharmacy with full operational responsibility — precision, accountability, and problem-solving under real pressure.
- Translated this domain expertise directly into software: designed and built PharmaCare, a complete pharmacy management system (Node.js, React, MySQL) with FEFO logic, prescription management, and an AI assistant with live inventory context.

PROJECTS

Shipyard — Static-Site Deployment Platform

Live: shipyard.shpit.uk

- Built a GitHub-connected deployment platform: a webhook-triggered pipeline builds every push inside a fresh, isolated Docker container (hard CPU/memory/time limits, no network path to host services) and ships the output to S3 within seconds.
- Replaced per-deployment DNS records with a Cloudflare Worker + KV edge router — one wildcard record serves unlimited *.shpit.uk subdomains with zero propagation wait.
- Streamed sanitized build logs to the browser in real time over authenticated Socket.io; queued builds with Redis + BullMQ so webhooks never block.
- Deployed the full stack to production: EC2 (Docker, nginx, Certbot), RDS MySQL, Redis Cloud, Cloudflare Pages/Workers, with least-privilege IAM scoped to exactly one S3 bucket.

Rakiz — Multi-Currency Wallet & Payments Platform

Live: rakiz.uk

- Engineered a bank-grade ledger: every money movement flows through one double-entry chokepoint with SELECT FOR UPDATE row locking, Redis-checked idempotency keys, and a full audit trail.
- Built multi-currency wallets (6 currencies), bill splitting, payment requests, and shareable payment links, with live exchange rates and Stripe subscription billing synced via verified webhooks.
- Implemented refresh-token rotation with family-based theft detection, device fingerprinting, AES-256-GCM encryption of stored IPs, and an AI-assisted admin fraud queue.

Acelt — AI Interview Coaching SaaS

Live: ace-it-eight.vercel.app

- Built an AI-powered platform combining ATS-style CV scoring, no-repeat mock interviews, and skill quizzes — every weakness auto-populates a self-updating improvement roadmap.
- Enforced three subscription tiers server-side at the API layer, with S3 pre-signed URL document storage and full PDF report export.

Tawla — Multi-Tenant Restaurant POS (SaaS)

6 roles · real-time

- Designed a multi-tenant SaaS POS where one deployment serves unlimited restaurants with complete data isolation — every query scoped by `restaurant_id`.
- Delivered real-time order flow across waiter, kitchen, owner, and delivery screens via per-restaurant Socket.io rooms, plus an OpenAI upsell engine that reads each restaurant's live menu.

PharmaCare — Pharmacy Management System

Built from 5+ yrs domain experience

- Built a complete pharmacy system: brand/active-ingredient inventory, prescriptions with insurance coverage math and automatic stock deduction, supplier orders, and low-stock/expiry alerting.
- Integrated an AI consultation assistant with live inventory context (stock, prices, expiry) that recommends FEFO dispensing, plus a weight-based dosage calculator with renal adjustments.

JARVIS — Agentic Terminal AI Assistant

In development

- Building a local-first, natural-language terminal agent (TypeScript, SQLite) on a real OpenAI function-calling loop — the model chooses and chains tools (file read/search, web search, GitHub) with results fed back multi-turn.
- Designed a provider-agnostic AI adapter layer and a central tool registry; destructive actions are architecturally gated behind typed confirmation phrases.
